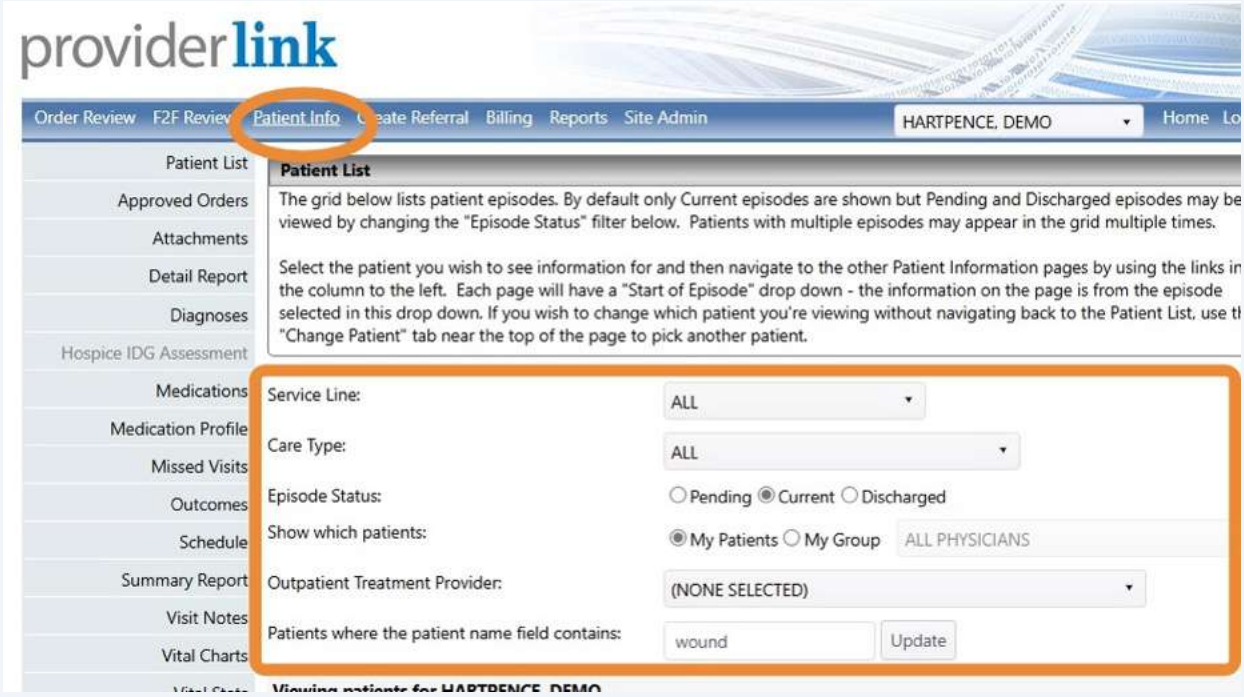
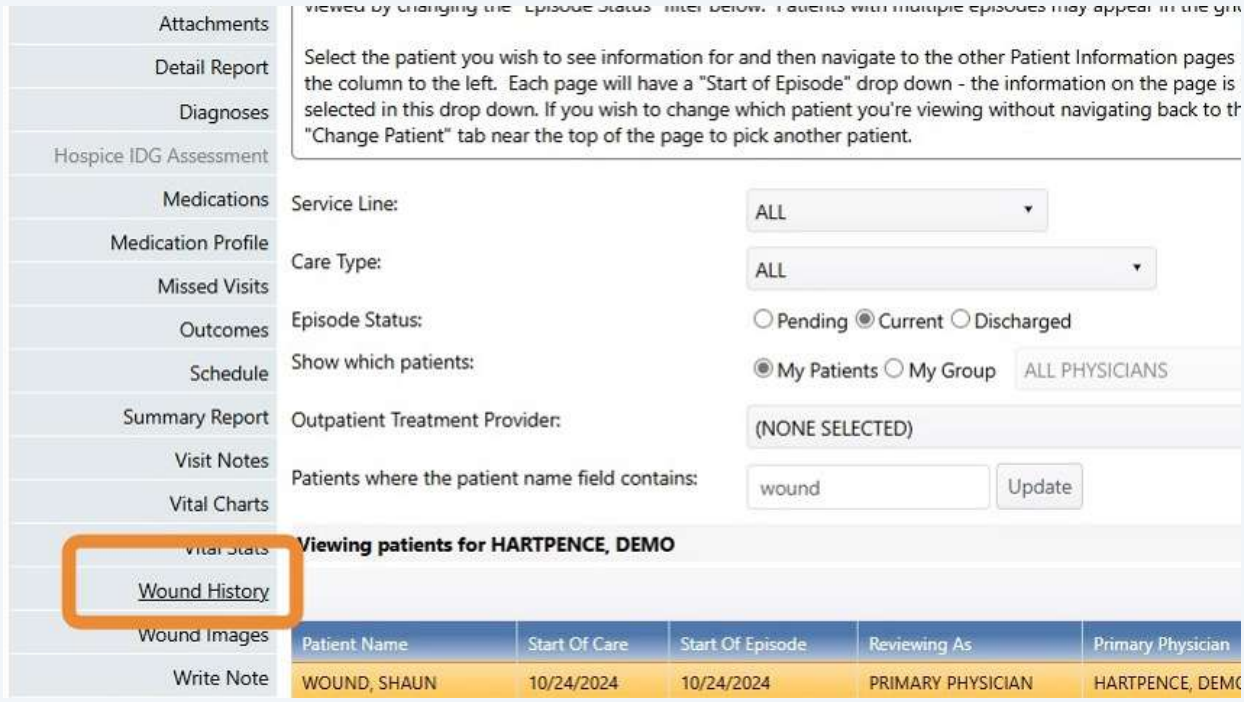
Provider Link: How to View Wound History and Wound Attachments

This guide is essential for anyone needing to efficiently access and manage wound history and attachments within the HCHB Provider Link. It provides a straightforward, step-by-step process to view detailed wound data and images, ensuring healthcare providers can quickly obtain important patient information. Utilizing this guide will enhance workflow and improve patient care by making wound management more accessible and organized.

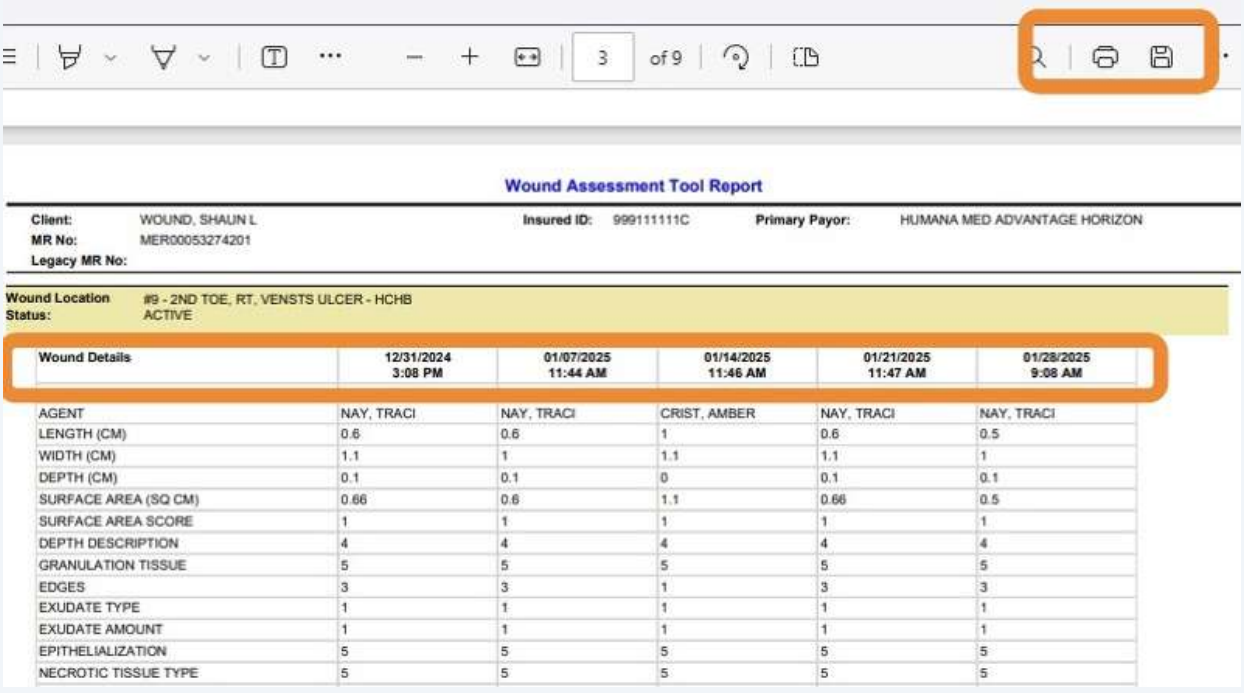
1 Once logged into Provider Link, click the *Patient Info* tab. The provider can search for the patient here or use any of the tabs in the gray column to switch patients if needed.



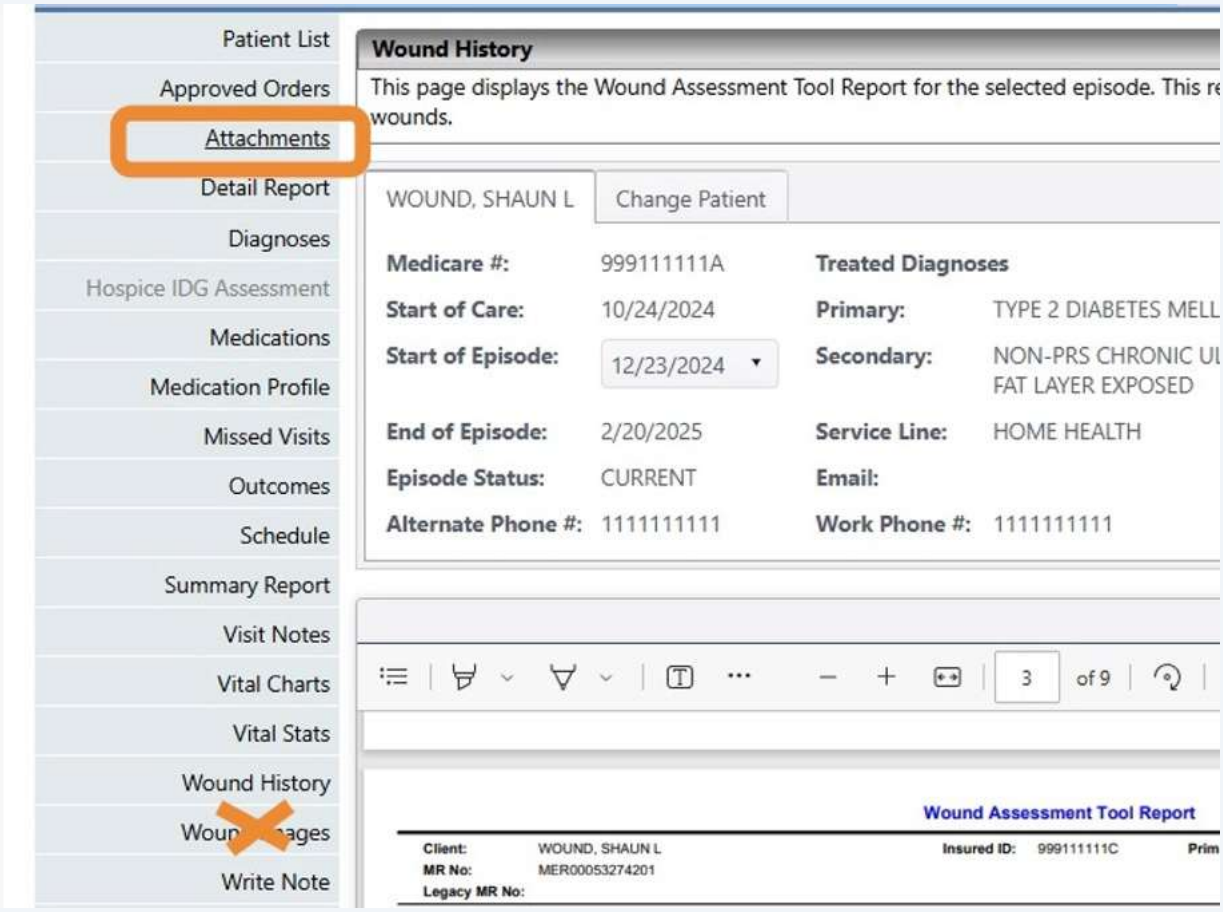
2 Click *Wound History* in the gray column to view wound documentation for the selected patient.



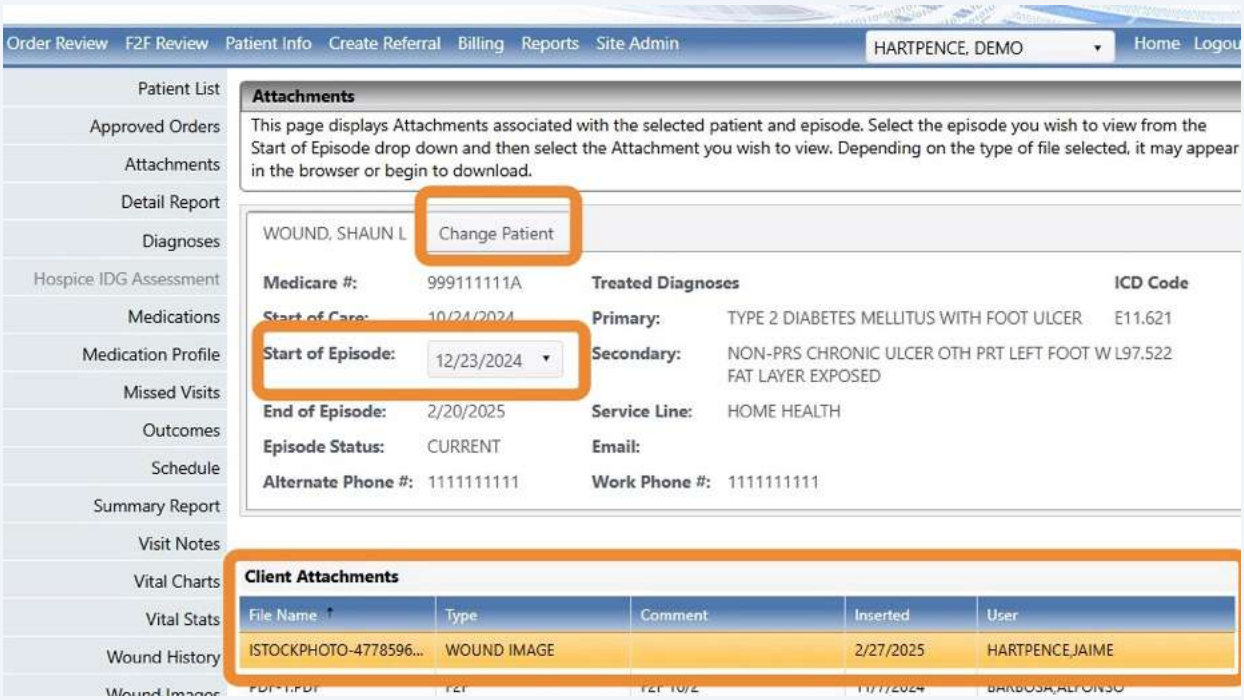
3 The provider can change the episode as needed. The *Wound Assessment Report* will display, showing wound details, including location, measurements, and the dates and times updates were recorded. These reports can be printed or saved for documentation or follow-up.

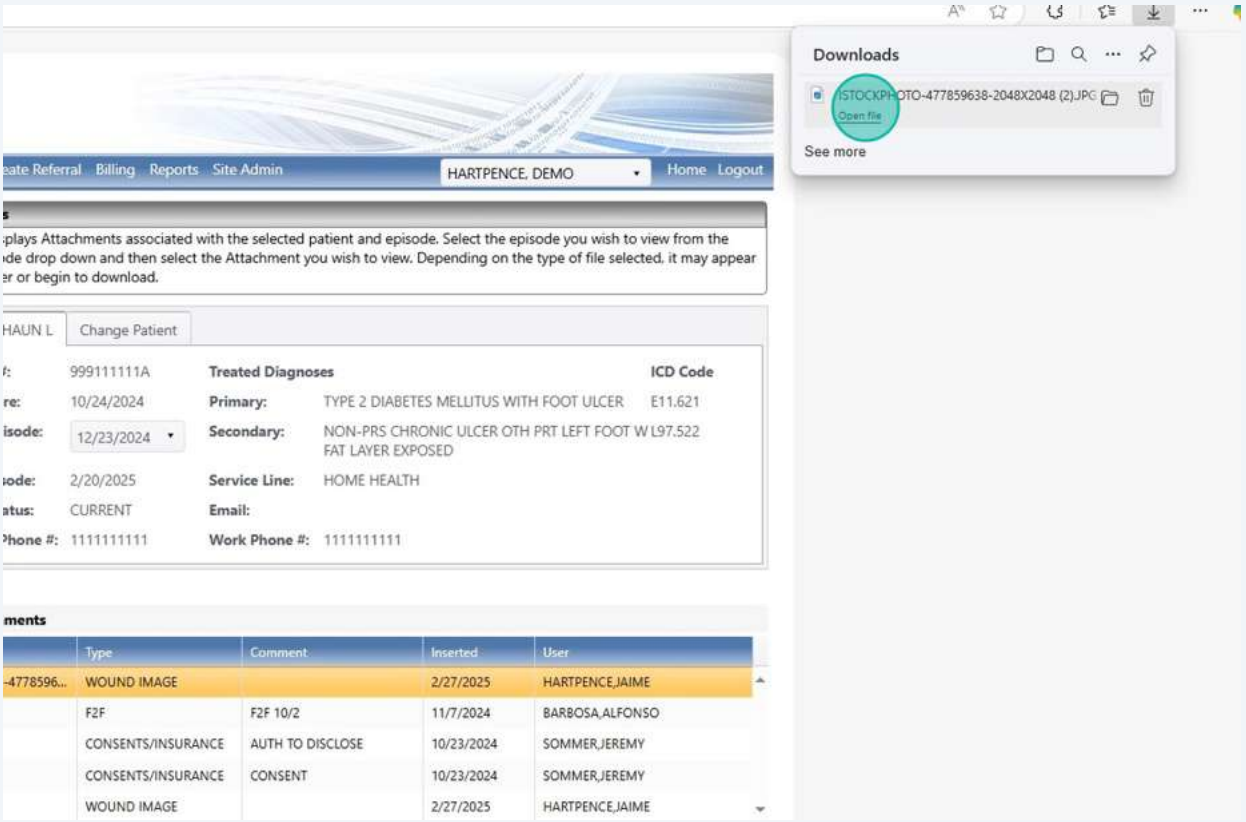


4 To view wound images, do *not* use the *Wound Images* tab. Instead, go to the *Attachments* section, where the wound photos are stored.



5 On this page, you can change the episode or patient as needed. You'll see both client attachments from Homecare Homebase and episode-specific attachments. To view a wound photo, double-click on the attachment labeled *WOUND IMAGE*.



6 The image will download—click *Open File* to view the wound photo.


Reviewing wound documentation and images in Providerlink supports timely assessment, tracks healing progress, and helps ensure continuity of care across the clinical team.
